Investigating the Association Between Demographic Factors and the Voting Outcome of the 2016 UK EU Referendum: Evidence from the 2023 British Social Attitudes Survey

Module: IJC466 Data Analysis

Programme: MSc Data Science, University of Sheffield

Grade: 72% (Distinction)

Word Count: 2,687

Abstract

Aim: This study aims to investigate the association between demographic factors (regional residence, sex, age, religion, and educational attainment level) and the voting outcome of the 2016 United Kingdom European Union Referendum.

Methods: The British Social Attitudes Survey 2023 (National Centre for Social Research, 2024) was utilised as the dataset for this study, and 6 variables were selected for analysis. Chi-square tests of independence and logistic regression were the statistical tests that were conducted.

Results and Conclusion: Education, sex, region, religion, and age all showed statistically significant associations with the outcome of the European Union Referendum. Education had the strongest association, while sex had the weakest. Older individuals and those with fewer qualifications were more likely to vote 'Leave', while younger and more highly educated people leaned toward 'Remain.' Men were slightly more likely to vote 'Leave' than women. Religious and regional patterns were also distinct. Anglicans showed the highest likelihood of voting 'Leave', whereas non-religious individuals favoured 'Remain'. Geographically, residents of the Midlands and the East of England leaned toward 'Leave', while those in Scotland showed the strongest support for 'Remain'. However, since this study utilised demographic data from the year 2023 to test associations between the voting outcome of the 2016 European Union Referendum and demographics, there are potential limitations regarding how accurately the results reflect the original electorate. Future research should utilise ethnically diverse datasets to explore the relationship between ethnicity and voting behaviour.

1.1 Context and Background

The United Kingdom's departure from the European Union on January 31, 2020, has resulted in a severe economic erosion. Bloom et al. (2025) estimate a cumulative GDP loss of 6% to 8% by 2025, driven by a 12% to 18% reduction in investment and a 3% to 4% decline in both productivity and employment. When contrasted with Ball's (2014) estimate that the 2008 financial crisis reduced average GDP by 8.4%, it becomes clear that Brexit represents an economic blow comparable to a major global financial crisis. Consequently, identifying the demographic factors associated with how people voted in the European Union Referendum is essential in potentially mitigating the recurrence of similar radical institutional shifts.

1.2 Literature Review:

Studies have found that the region of the United Kingdom in which the voter was living influenced the voting outcome, with economically deprived regions being more likely to have voted 'Leave', implying that economically prosperous regions were more likely to have voted 'Remain' (Becker et al., 2017; Haubmann & Ruttenauer, 2024). This may be due to individuals from economically marginalised regions being more likely to be politically dissatisfied (Lenzi & Perucca, 2025).

On the contrary, the magnitude of the association between an individual's sex and how they voted in the European Union Referendum was relatively small compared to other demographic factors (Fowler, 2024; Green & Shorrocks, 2023). This limited disparity between men and women was particularly prevalent among older voters, which may reflect the tendency for long-term partners to discuss politics and influence each other's views (Fowler, 2024).

Furthermore, studies find that lower levels of education were associated with voting for 'Leave', and this suggests that more highly educated voters tended to support 'Remain' (Alabrese et al., 2019; Zhang, 2018). In fact, Zhang (2018) indicates that education was the demographic that had the strongest influence on voting preference, claiming that if only 3% more of the adults in the United Kingdom had achieved higher education, the United

Kingdom would have remained in the European Union. A potential explanation for these associations may be because people with higher education tend to view immigration and immigrants in a more positive light (Umansky et al, 2025). In contrast, anti-immigration rhetoric played a central role in the Brexit campaign (Hobolt, 2016).

In addition, age was also identified as a demographic factor associated with the voting outcome, with older voters more likely to have voted 'Leave' and younger voters more likely to have voted 'Remain' (Eichengreen et al., 2021; Zhang, 2018). This generational divide may partly reflect differences in educational attainment, as younger people are statistically more likely than older people to hold higher qualifications, and lower levels of education have been associated with support for 'Leave' (Alabrese et al., 2019; Eichengreen et al., 2021).

Finally, there is a significant research gap regarding the influence that religion had on the voting outcome (Kolpinskaya & Fox, 2019; McAndrew, 2020). Consequently, this study aims to bridge this gap by examining the relationship between religious identity and voting preference while simultaneously validating existing research on established demographic variables.

1.3 Aims and Objectives

1.3.1 Aims

The primary aim of this research is to evaluate the relationship between demographic factors (age, sex, location, religion, and educational qualifications) and voting outcomes in the 2016 UK European Union Referendum, by utilising data from the British Social Attitudes Survey 2023 (National Centre for Social Research, 2024).

1.3.2 Objectives

- To examine the bivariate associations between individual demographic characteristics and referendum vote choice using chi-square tests of independence.

- To perform a multivariate logistic regression to calculate odds ratios and identify the unique contribution of each demographic factor while controlling for the other demographic variables.

2. Methods

2.1 Data Collection

The dataset used for this study was the British Social Attitudes Survey 2023 (National Centre for Social Research, 2024). This survey has been tracking the public's economic, political, moral, and social attitudes since 1983, with a new survey being released every year. This study utilised the survey from the year 2023. This survey used mixed-mode collection, with some of the data being collected online and some over the phone between the 12th of September and the 31st of October 2023. There were 10 different versions of this survey, each comprised of different questions. There were 5,578 respondents (Ratti et al., 2024).

Table 1 highlights the 6 variables chosen for this study. The dependent variable selected was EURefVote, which was whether the respondent voted for the United Kingdom to 'Leave' or 'Remain' in the European Union. Note: 4,174 respondents were asked this question. The independent demographic variables selected for this study were RespAge_Archive(respondent's current age), DVsex23(respondent's sex), GOR(respondent's government office region), Religsum(respondent's religion), and HEdQual2(respondent's highest education attained).

Table 1: *6 Selected Variables from the British Social Attitudes Survey 2023 for Analysis*

No.	Code	Variable labels	Variable Values	Type of Variables
1.	**EURefVote**	Did you vote to remain a member of the EU or to leave the EU?	1. Remain a member of the European Union 2. Leave the European Union 8. Don't Know 9. Prefer not to answer -1. Missing (Not applicable)	Categorical **(Dependent)**
2.	**RespAge_Archive**	Current Age	integer: range (18 – 80 or more) **Note:** 22. 18-22 80. 80 or more 999. Prefer not to answer	Continuous **(Independent)**
3.	**DVsex23**	Respondent's Sex	1. Female 2. Male 9. Prefer not to answer	Categorical **(Independent)**
4.	**GOR**	Respondent's Government Office Region	1. North East 2. North West 3. Yorkshire and The Humber 4. East Midlands 5. West Midlands 6. East of England 7. London 8. South East 9. South West 10. Wales 11. Scotland	Categorical **(Independent)**

5.	**Religsum**	Respondent's Religion	1. Church of England/Anglican 2. Roman Catholic 3. Other Christian 4. Non-Christian 5. No religion 6. Don't Know/Refused/Not answered	Categorical **(Independent)**
6.	**HEdQual2**	Highest Educational Qualification Attained	1. Degree or equivalent, and above 2. Other Higher Education, including Diplomas in Higher Education, HNC and HND 3. A-levels/SCE Highers including vocational level 3 or equivalent, and above 4.Qualifications below A-levels, such as GCSE/O Level/Standard Grade, vocational level 2 or equivalent 6. No qualifications 8. Don't know 9. Prefer not to answer	Categorical **(Independent)**

2.2 Data Pre-Processing

Table 2 displays the derived variables used in the analysis. Cases with missing data, 'Don't know' responses, or 'Prefer not to answer' selections were excluded across all variables. Below is a summary of the derived variables:

EUVote (Dependent Variable): Derived from EURefVote, this variable was recoded into a binary dependent variable: 0 (Remain) and 1 (Leave). A total of 1,467 cases were excluded, including missing cases (1404 respondents were not asked this particular question), 'Don't know' (n = 6), and 'Prefer not to answer' (n = 57).

Age_EURef: To reflect respondent age at the time of the 2016 referendum, seven years were subtracted from the continuous RespAge_Archive variable. The new ordinal categorical variable categorised respondents into five groups: 1 (18–24), 2 (25–34), 3 (35–50), 4 (51–64), and 5 (65+). Exclusions included those who preferred not to answer (n = 31) and those ineligible to vote in 2016 due to age (n = 314).

SexofResp: Recoded from DVsex23 into 1 (Female) and 2 (Male). 'Prefer not to answer' (n = 4) responses were excluded.

Location: The GOR (Government Office Region) variable was collapsed into six broader geographical categories: 1 (London), 2 (South East England and South West England), 3 (Midlands and the East of England), 4 (North East England, North West England, and Yorkshire and The Humber), 5 (Wales), and 6 (Scotland).

Religion: Recoded from Religsum into five categories: 1 (No Religion), 2 (Non-Christian), 3 (Other Christian), 4 (Roman Catholic), and 5 (Church of England/Anglican). 'Don't know/Refused' (n = 79) responses were treated as missing.

Education: Derived from HEdQual2, this variable was recoded into five levels ranging from 1(Degree or equivalent, and above) to 5 (No qualifications). Exclusions included 'Don't know' (n = 90) and 'Prefer not to answer' (n = 48).

Table 2: *The 6 Derived Variables for Analysis*

No.	Code	Variable labels	Variable Values	Type of Variables
1.	**EUVote**	Respondent's Vote in the EU Referendum	0. Remain a member of the European Union 1. Leave the European Union	Categorical **(Dependent)**
2.	**Age_EURef**	Respondent's Age Group at the Time of the EU Referendum	1. 18 – 24 2. 25 – 34 3. 35 – 50 4. 51 – 64 5. 65+	Categorical **(Independent)**
3.	**SexofResp**	Respondent's Sex	1. Female 2. Male	Categorical **(Independent)**
4.	**Location**	Region of the United Kingdom that Respondent Lives In	1. London 2. South East England and South West England 3. East Midlands, West Midlands, and the East of England 4. North East England, North West England, and Yorkshire and The Humber 5. Wales 6. Scotland	Categorical **(Independent)**

5.	**Religion**	Respondent's Religion	1. No religion 2. Non-Christian 3. Other Christian 4. Roman Catholic 5. Church of England/Anglican	Categorical **(Independent)**
6.	**Education**	Respondent's Highest Educational Qualification Attained	1. Degree or equivalent, and above 2. Other Higher Education, including Diplomas in Higher Education, HNC and HND 3. A-levels/SCE Highers including vocational level 3 or equivalent, and above 4.Qualifications below A-levels, such as GCSE/O Level/Standard Grade, vocational level 2 or equivalent 5. No qualifications	Categorical **(Independent)**

2.3 Statistical Methods for Analysis

Statistical analysis was performed using SPSS version 31.0.0.0. Findings were deemed statistically significant where the *p*-value was less than 0.05. Table 3 displays the statistical tests undergone for the research question. Given that all variables in the study were categorical, non-parametric tests were required. Chi-square tests of independence were

utilised for initial bivariate analysis, followed by binary logistic regression to identify statistically significant associations and estimate relative likelihoods through odds ratios.

Table 3: *Statistical Tests and Variables Used*

Research Question/ Alternative Hypothesis	**Statistical Tests and Variables Used**
RQ1.	**Is there a statistically significant association between demographic factors and vote choice in the UK EU Referendum?**
(H1.1)	There is a statistically significant association between age and UK EU Referendum voting preference.
	Chi-Square Test of Independence (EUVote ~ Age_EURef)
(H1.2)	There is a statistically significant association between sex and UK EU Referendum voting preference.
	Chi-Square Test of Independence (EUVote ~ SexofResp)
(H1.3)	There is a statistically significant association between geographic region and UK EU Referendum voting preference.
	Chi-Square Test of Independence (EUVote ~ Location)
(H1.4)	There is a statistically significant association between religion and UK EU Referendum voting preference.

	Chi-Square Test of Independence (EUVote ~ Religion)
(H1.5)	There is a statistically significant association between educational attainment level and UK EU Referendum voting preference.
	Chi-Square Test of Independence (EUVote ~ Education)
(H1.6)	There is a statistically significant association between the demographic factors (age, sex, geographic region, religion, and educational attainment) and UK EU Referendum voting preference.
	Logistic Regression (EUVote ~ Age_EURef + SexofResp + Location + Religion + Education)

3. Results

3.1 Descriptive Analysis

Regarding age distribution, Table 4 highlights that the largest cohorts among those who provided their age were those aged 51–64 (29%) and 35–50 (27.6%). Based on Table 5, participants were primarily concentrated across three regions of England, each representing approximately 25% of the total: North East England, North West England, and Yorkshire and The Humber (25.1%), the Midlands and the East of England (25%), and South East England

and South West England (24.9%). Table 6 displays that female respondents represented a larger proportion of the sample (57%) than male respondents (43%).

Table 4: *Descriptive Statistics for Age Group (N = 5578). Missing data: 345 (6.2%)*

Age Group	***n***	**Valid %**
18 – 24 years	566	10.8
25 – 34 years	927	17.7
35 – 50 years	1442	27.6
51 – 64 years	1520	29.0
65+ years	778	14.9
Total	5233	**100**

Table 5: *Descriptive Statistics for Region (N = 5578).*

Region	***n***	**Valid %**
London	610	10.9
South East England and South West England	1387	24.9
Midlands and the East of England	1397	25
North East England, North West England, and Yorkshire and The Humber	1399	25.1
Wales	288	5.2
Scotland	497	8.9
Total	**5578**	**100**

Table 6: *Descriptive Statistics for Sex (N = 5578). Missing data: 4 (0.1%)*

Sex	***n***	**Valid %**
Female	3177	57
Male	2397	43
Total	**5574**	**100**

Regarding educational attainment, Table 7 indicates that respondents were highly educated. Among those who provided their qualifications, the largest proportion (45.6%) had achieved a university degree or higher. This was followed by those with qualifications below A-level (19.2%). Religious affiliation (Table 8) shows that over half of the participants who provided a response (51.1%) identified as having no religion, followed by other Christian denominations (22.5%) and Anglican (13.0%).

While missing data across demographic variables remained minimal (ranging from 0.1% to 6.2%), Table 9 reveals a significantly higher missing data rate for the dependent variable (26.3%). This is primarily attributed to survey design, as 1,404 individuals were not administered this specific question. Among those who provided a response, 61.6% reported voting to remain in the European Union, while 38.4% voted to leave.

Table 7: *Descriptive Statistics for Educational Attainment (N = 5578). Missing data: 138 (2.5%)*

Educational Attainment	***n***	**Valid %**
Degree or equivalent, and above	2478	45.6
Other Higher Education, including Diplomas in Higher Education, HNC and HND	786	14.4
A-levels/SCE Highers including vocational level 3 or equivalent, and above	706	13.00
Qualifications below A-levels, such as GCSE/O Level/Standard Grade, vocational level 3 or equivalent	1042	19.2
No qualifications	428	7.9
Total	**5440**	**100**

Table 8: *Descriptive Statistics for Religion (N = 5578). Missing data: 79 (1.4%)*

Religion	***n***	**Valid %**

Remain a member of the EU	2531	61.6
Leave the EU	1580	38.4
Total	**4111**	**100**

3.2 Chi-Square Tests of Independence Results

All of the below Chi-square tests were valid, as all expected cell counts exceeded five and sufficient observations were recorded for each category.

Age and Voting Preference: As demonstrated in Table 10, a statistically significant relationship exists between age group and voting outcome ($X^2 = 125.082$; $df = 1$; $p < .001$). The data reveals a distinct generational divide; of the 338 respondents aged 18–24, 271 (**80.2%**) voted to 'Remain', compared with 347 (**48.4%**) of the 717 respondents in the 65+ category. Conversely, support for 'leave' peaked among the oldest cohort, with 370 (**51.6%**) of 717 respondents voting for this option, **compared with** only 67 (**19.8%**) of those in the 18–24 age group.

Sex and Voting Preference: Table 11 indicates a statistically significant, but weaker, relationship between sex and voting outcome ($X^2 = 5.029$; $df = 1$; $p = 0.025$). While statistically significant, the percentage margin between groups was relatively narrow. Of the 2,267 female participants, 1,431 (**63.1%**) voted to 'Remain', compared with 1,100 (**59.7%**) of the 1,844 male respondents. Correspondingly, support for 'Leave' was only slightly more

prevalent among men, at **40.3%** (744 of 1,844), compared with **36.9%** (836 of 2,267) among women.

Region and Voting Preference: Table 12 reveals a statistically significant geographical divide in voting preference ($X^2 = 107.207$; $df = 5$; $p < .0001$). Scotland exhibited the highest support for European Union membership, where 310 (**78.5%)** of 395 respondents voted to 'Remain', compared with **53.6%** (556 of 1,038) of participants residing in the East Midlands, West Midlands, and the East of England. Support for 'Leave' was most pronounced in the combined Midlands and the East of England regions, where 482 (**46.4%**) of 1,038 respondents voted for the option, compared with just **21.5%** (85 of 395) of the respondents that lived in Scotland.

Religion and Voting Preference Table 13 reveals a statistically significant relationship between religious affiliation and voting preference ($X^2 = 110.441$; $df = 4$; $p < .001$). Respondents who identified as non-religious exhibited the highest support for EU membership, with 1,385 (**68.4%**) of 2,025 voting to 'Remain', **compared with 48.2%** (308 of 639) of those identifying as Anglican. Conversely, support for 'Leave' was most pronounced among the Anglican cohort, where 331 (**51.8%**) of 639 respondents favoured the option, **compared with 31.6%** (640 of 2,025) of non-religious participants.

Educational Attainment and Voting Preference: Table 14 illustrates a statistically significant educational divide in voting behaviour ($X^2 = 433.612$; $df = 1$; $p < 0.001$). A substantial **77.4%** (1,495 of 1,931) of participants holding a university degree or higher qualification voted to 'Remain', compared with only **34.5%** (101 of 293) of respondents with no formal educational qualifications. Furthermore, opposition to EU membership was notably higher among those with no qualifications, where 192 (**65.5%**) of 293 participants voted to 'Leave', compared with a significantly lower **22.6%** (436 of 1,931) among those with degree-level education or higher.

Table 10: *Frequency of 'Remain' and 'Leave' Votes Across Age Groups*

Age Group	Voted to Remain in the European Union	Voted to Leave the European Union	Total
18 – 24 years	271 (80.2%)	67 (19.8%)	338
25 – 34 years	422 (70.9%)	173 (29.1%)	595
35 – 50 years	679 (62.6%)	406 (37.4%)	1085
51 – 64 years	784 (58.7%)	551 (41.3%)	1335
65+ years	347 (48.4%)	370 (51.6%)	717
Total	2503 (61.5%)	1567 (38.5%)	4070

Overall significance: significant (p <.001); X^2 = 125.082; df = 1; n = 4070

3.3 Logistic Regression

Prior to conducting the logistic regression analysis, multicollinearity was assessed using Variance Inflation Factors (VIF). All values were found to be < 5, indicating no problematic collinearity between the demographic predictors. Table 15 shows that the resulting model explained approximately 20% of the variance in the EU Referendum voting outcome (Nagelkerke $R^2 = .199$). While all demographic variables reached overall statistical significance ($p < .001$, except for sex at $p = 0.011$), the magnitude of their association with the voting outcome varied considerably.

Educational attainment demonstrated the strongest pull within the model; respondents who had no educational qualifications were 5.831 times more likely than respondents with university degrees or above to vote to leave the European Union ($p < .001$). This was followed by geographic region as the next most substantial factor, where respondents who lived in the Midlands or the East of England saw a 110% increase in the odds of voting 'Leave' compared to participants that lived in London ($p < .001$). Notably, Scotland was the

only region significantly associated with decreased odds of voting 'Leave' compared to London (*OR* = 0.661, *p* = 0.025).

Significant associations were also observed for age and religion, though certain subcategories, specifically ages 25–34 (*p* = 0.082), Non-Christian (*p* = 0.338), and Roman Catholic (*p* = .164), did not differ significantly from their respective reference groups. However, respondents aged 65 and over saw a 106% increase in the odds of voting 'Leave' compared to those aged 18 to 24 (*p* < .001), and participants identifying as Anglican were 1.716 times more likely to vote 'Leave' than non-religious respondents (*p* < .001). Finally, sex demonstrated the weakest association in the model; male participants had a 20% increase in the odds of voting to leave the European Union compared to female respondents (*p* = .011).

Table 15: *Logistic Regression Results*
(Dependent variable = EUVote; Nagelkerke R^2 = .199; n = 3978)

Independent Variable (Reference Category)	**Categories**	**Odds Ratio (95% CI)**	**P-Value**
Age groups at the time of the EU Referendum*	25 - 34	1.349 (0.962 -1.891)	.082
(18 – 24)	35 - 50	1.646 (1.204 – 2.250)	.002
	51 - 64	1.536 (1.125 – 2.098)	.007
	65+	2.057 (1.473 – 2.873)	<.001
Educational Attainment Level*	Other Higher Education, including Diplomas in Higher Education, HNC and HND	2.240 (1.829 – 2.742)	<.001
(Degree or equivalent, and above)	A-levels/SCE Highers including vocational level 3 or equivalent, and above	3.229 (2.595 – 4.016)	<.001
	Qualifications below A-levels, such as GCSE/O Level/Standard Grade, vocational level 3 or equivalent	4.277 (3.538 – 5.170)	<.001
	No qualifications	5.831 (4.411 – 7.708)	<.001

4. Discussion

Analysis of the demographic variables confirmed that age, sex, regional location, educational attainment, and religious affiliation all had statistically significant associations with the 2016 EU Referendum outcome. Even when controlling for all other demographic variables in the logistic regression model, educational attainment had the strongest association with voting behaviour, a finding that strongly corroborates existing literature (Zhang, 2018). The data indicates that individuals with lower educational qualifications demonstrated a significantly higher likelihood of supporting the 'Leave' campaign compared to university graduates (Alabrese et al., 2019). This difference may be rooted in differing threat perceptions; highly educated cohorts are statistically less likely to perceive asylum seekers as a threat (Velasquez & Eger, 2022), whereas the anti-immigration rhetoric central to the Brexit campaign resonated more strongly with those possessing fewer educational qualifications (Hobolt, 2016).

Geographic disparities further highlight the socio-economic divide within the electorate. Residents of the Midlands and the East of England, regions characterised by lower economic prosperity (McCann & Ortega-Argiles, 2021) and higher unemployment (Papyrakis et al., 2025), showed a notably higher association with the 'Leave' vote than those residing in London. This aligns with the 'left behind' concept, where support for 'Leave' is concentrated in economically deprived areas (Becker et al., 2017; Haubmann & Ruttenauer, 2024). However, people residing in Scotland showed the highest likelihood of voting for 'Remain'. This contradicts the idea of the socio-economic divide being the primary explanation of the

regional differences in voting. Heaney et al. (2023) suggest this is because Scottish voters saw Brexit as an English-led movement that conflicted with their national identity, while they viewed Scottish and European identities as being naturally compatible. Ultimately, this indicates that while economic deprivation was a significant factor for voting for 'Leave', regional voting patterns across the wider United Kingdom were driven by a combination of identity, culture, and national belonging rather than financial status alone.

The results also underscore a profound generational divide. Older voters were significantly more likely to favour 'Leave', while younger generations leaned toward 'Remain' (Eichengreen et al., 2021; Zhang, 2018). While this is partially explained by the higher concentration of university degrees among young people (Eichengreen et al., 2021), it also points toward differences in the formative years between generations. Older cohorts, who came of age during an era of absolute national sovereignty, appear more inherently Eurosceptic than younger voters who matured within a deeply integrated European Union and are accustomed to such Eurocentric structures (Fox & Pearce, 2018).

Furthermore, this study addresses the existing research gap regarding the role of religion in British voting behaviour (Kolpinskaya & Fox, 2019). The findings reveal that Anglicans were significantly more likely to endorse 'Leave', whereas non-religious individuals showed a clear preference for 'Remain'. This religious divide may be attributed to the institutional history of the Church of England, which is inextricably linked to English national identity and a desire for independence from European power structures (Merrick, 2021). For these individuals, the EU represents a fundamental challenge to British sovereignty, a concern less prevalent among non-religious voters.

Finally, sex demonstrated the weakest association in this study, which is supported by recent literature (Fowler, 2024; Green & Shorrocks, 2023). However, men were slightly more likely to support 'Leave' than women. This gap appears particularly pronounced among older adults, where long-term partnerships may facilitate a sharing of political views (Fowler, 2024).

5. Conclusion

Table 16: *Conclusion*

In conclusion, this study found a statistical relationship between the voting outcome of the European Union Referendum and several demographic factors, including region residence, sex, age, educational attainment, and religion. Education had the strongest relationship with voting behaviour. Sex had the weakest association, compared to the other demographic factors tested. While this study provided support for existing literature on the association between demographics and European Union Referendum voting behaviour, as well as addressed research gaps regarding religious affiliation and vote choice, this study had limitations that warrant consideration. A major limitation of this study is the seven-year gap between the 2016 Referendum and the data collection in 2023. By utilising 2023 data, the analysis was conducted on the assumption that demographic variables, particularly region of residence and education, had remained the same. This data may not be fully representative of the 2016 electorate, as relocation and further schooling could have occurred during the 7-year period. Secondly, the dataset does not contain data from voters who lived in Northern Ireland and is therefore not entirely representative of the 2016 Referendum voter base. The unique cultural perspective of Northern Ireland is not represented by this dataset. Finally, the vast majority of respondents were White British and either non-religious or Christian. The results of this study showed that 80% of the variance in the voting outcome was explained by factors not tested. Furthermore, Touihri-Mebarek (2023) suggests that the European Union Referendum voting behaviour of ethnic and religious minorities is under-investigated. Therefore, future studies should incorporate more ethnically diverse datasets and explore the relationship between ethnicity and the European Union Referendum voting outcome. Also, the association between religion and voting outcome should be further explored with more religiously diverse datasets.
